1. TOKEN IDENTIFICATION

Name	AIR3 Agent by AIRewardrop
Symbol	AIR3
Blockchain	Solana
Mint address	2jvsWRkT17ofmv9pkW7ofqAFWSCNyJYdykJ7kPKbmoon
Supply totale	968.000.000 AIR3
Price (Detected)	~$0,000132
Market Cap (rilevato)	~$128.000
Website	airewardrop.xyz
X / Twitter	@AIRewardrop
Telegram	t.me/AIR3Community
Discord	discord.gg/S4f87VdsHt
Main Pools	Meteora: AIR3/SOL, AIR3/USDC

Sources: DexScreener API (market data and trading pairs), RugCheck.xyz (on-chain token and liquidity analysis)

2. Technical Smart Contract Audit

Analysis of on-chain token properties to identify functions or permissions that could be used maliciously (arbitrary minting, wallet freezing, blacklisting, hidden fees, etc.).

Check	Result	Details
Mint Authority (ability to create new tokens)	**REVOKED**	The "Mint Authority" field is missing (–). The creator cannot mint new AIR3: excludes the risk of arbitrary supply dilution/inflation.
Freeze Authority (ability to freeze wallets)	**NO RISK REPORTED**	RugCheck does not report active or abuseable freeze functions in its automated scanner (overall verdict "No risks found"). Manual inspection of the on-chain flag via direct RPC was not possible in this session.
Token-2022 Extensions (transfer fee, permanent delegate, transfer hook)	**NOT DETECTED**	No risky extensions reported by consulted scanners. The token appears as a standard SPL Token.
Honeypot / Sale block functions	**NO RISK REPORTED**	Automated scanners do not report honeypot patterns; regular sell transactions are observed in the analyzed pools.
Mutable Metadata	**NOT VERIFIED**	It was not possible to confirm the "immutable" status of metadata (name, symbol, URI) via direct inspection.
RugCheck Automated Score	**GOOD (1/minimal risk)**	"No risks found" in the automated scan on 07/25/2026. Don't Trust, Verify.

Don't Trust, Verify.

Methodological limitation: This assessment is based on automated analysis by RugCheck.xyz, not on a byte-by-b review of the on-chain program (which for a standard SPL token coincides with the official Solana Token program and immutable at the network level). It does not replace an audit conducted by a specialized auditor with direct ac node.

3. Full Ecosystem Audit

3.1 Holder Distribution

Total number of holders: 1,482. Concentration of top 20 wallets: 52.15% of the supply (including the Meteora liquidity pool, which alone accounts for 9.98% and is not a "free" holder).

#	Wallet	% Supply	Note
1	Meteora Pool	9,98%	Market liquidity (not a private wallet)
2	E6HB..tH3y	6,50%	External wallet
3	38sh..5KRK	5,16%	External wallet
4	CbVL..swk1	5,11%	External wallet
5	goL4..AoGC	4,17%	External wallet
6–11	—	≈16,89%	6 wallets between 2.4% and 3.2% each
13	Creator (Ehvs..78kz)	2,03%	Creator/deployer wallet
14–20	—	≈9,52%	7 wallets between 1.2% and 2.0% each

Assessment: Moderate concentration. No single private wallet exceeds 6.5% of the supply; the creator's wallet holds only 2.03%, a low figure compared to many similar projects. The risk of a coordinated "dump" by a single insider is limited, but the total of the top 20 wallets (excluding the pool) remains significant (~42%) for a low-capitalization token: movements by even a few wallets can generate heavy volatility

3.2 Liquidity and LP Lock

Main pool liquidity (AIR3/SOL)	~$25.600
Secondary pool liquidity (AIR3/USDC)	~$1.240
Aggregate liquidity (RugCheck)	~$11.000
LP Locked	**95,11%**
Platform:	Meteora (DYN / DLMM)

The locked liquidity share (95.11%) is high and reduces the classic "rug pull" risk via sudden liquidity removal. However, it should be emphasized that absolute liquidity is very low (in the tens of thousands of dollars range): even without malice,trades of a few thousand dollars can move the price drastically (high risk of slippage and volatility).

3.3 Reward / Staking / Bridge / Treasury

The official website (airewardrop.xyz) presents the project as an "autonomous agents" infrastructure for the crypto sector. Dynamic page loading prevented reliable text extraction regarding reward, staking, bridge, or treasury/tokenomics mechanics declared by the team during this session. No separate staking contracts, bridges, or treasury vaults associated with the AIR3 mint were identified through the consulted on-chain scanners: only a single SPL token with a liquidity pool on Meteora is present. This point cannot be confirmed or excluded with certainty based solely on the sources consulted.

3.4 Team / Creator Wallet

Don't Trust, Verify.

Creator wallet identified on-chain: Ehvs...78kz, with a balance equal to 2.03% of the supply (20,000,000 AIR3). No specific vesting or lockups are reported for this wallet in the consulted scanners.

The same wallet appears as the creator of at least two other tokens: NSFW and SLUN (both launched about 10 months ago, current market cap ~$6,700 each, making them substantially inactive/abandoned). The pattern of serial launches of low-cap tokens is common among speculative micro-cap creators on Solana and represents a caution flag (not necessarily malicious, but indicative of a risk profile that is more speculative than that of an established project).

3.5 Tokenomics

Total supply	968,000,000 AIR3 (fixed, mint revoked)
Team-declared allocation	Not verifiable in this session (website inaccessible)
On-chain observed distribution	See holder table §3.1
Declared burn/deflation mechanisms	Not verified

Verify
Don't Trust, Verify.

4. RISK SUMMARY

Risk Area	Risk Level	Summary Rationale
Malicious contract functions	Low	Mint revoked; no risky extensions or functions detected by scanners
Holder concentration	Medium-Low	No private wallet > 6.5%; creator at 2.03%; top 20 ~52% including pool
Liquidità / LP lock	Medium	95.11% locked (positive), but absolute liquidity is very low (high volatility)
Trasparenza reward/staking/bridge/treasury	Not Evaluable	Website data could not be extracted during this session.
Creator history	Caution	Serial creator of micro-caps (NSFW, SLUN), both currently inactive

Overall Judgment: From a strictly technical/on-chain perspective, AIR3 does not exhibit classic malicious functions (arbitrary minting, active freeze/blacklist, honeypot) detectable by the automated tools consulted, and liquidity is largely locked. However, this is a token with a very small market capitalization (~$128K), meager absolute liquidity, and a creator with a history of other currently inactive tokens: the profile is that of a high-risk speculative market asset, regardless of the absence of malicious code.
